

Appendix A. Limit of Detection Table

The analytical limit of detection (LOD) for each of the different chemical measurements is presented in the table below. The LOD is the level at which the measurement has a 95% probability of being greater than zero (Taylor, 1987). For most chemicals, the LOD is constant for each sample analyzed. However, for dioxins, furans, PCBs, organochlorine pesticides, and some other pesticides, each individual sample has its own LOD. These analyses have an individual LOD for each sample, mostly because the sample volume available for analysis differed for each sample. A higher sample volume results in a lower LOD and a better ability to detect low levels.

For chemicals with sample-specific LODs, we report in the table the maximum LOD among the samples analyzed. In

general, the average LOD for these samples is about 40-50% of the maximum LOD. If a geometric mean or percentile estimate is less than the maximum LOD, it is noted in the results tables, and we do not report a number for that estimate. This conservative approach is to assure high confidence in all numbers reported in the results tables.

As analytical methods improve, LODs will often improve. For this reason, LOD results are reported by survey periods (e.g., 1999-2000, 2001-2002). Therefore, it is possible that the same chemical levels may be less than the LOD in 1999-2000 and greater than the LOD in 2001-2002.
